

2. (15 points) Consider the following axiom system.

Undefined Terms: point, line, on

Axiom 1: Any two distinct points are on exactly one line.

Axiom 2: There exist at least three points not all of which are on the same line.

Axiom 3: Each line is on at least two distinct points.

Axiom 4: If  $l$  is a line and  $P$  is a point not on the line, there exists another line that is on  $P$  but is not on any point that is also on  $l$ .

(a) Verify the consistency of this axiom system with the use of a model.

dots  $\leftrightarrow$  points ✓  
curves  $\leftrightarrow$  lines

The existence of a model establishes the consistency of our axiom system. ✓

(b) Show that Axiom 2 is independent of the other axioms. Start by explaining your strategy.

✓ We establish the independence of  $A_2$  by displaying a model satisfying  $A_1, A_3, A_4$  but not  $A_2$ .

Model 1: the empty set ✓

model 2: 

(c) In this geometry prove or disprove: There exists at least four points

By  $A_2$  there exists 3 points, say  $A, B, C$ , that are not on the same line. By  $A_1$ ,  $A$  and  $B$  are on the same line  $l$ . By  $A_4$  there is another line  $m$  that contains  $C$  that has no points in common with  $l$ . By  $A_3$ , line  $m$  must contain a point  $D$  other than  $C$ . Of course  $D$  is neither  $A$  nor  $B$ , so  $D$  is a fourth point. Consequently, there exists at least four points. ✓
