

Some Notes for Sections 4.2 & 4.3

The **Euclidean plane**, denoted by E^2 , is $\{(x,y,1): x, y \in \mathbb{R}\}$. We will denote elements of E^2 by

column vectors $\begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$.

A transformation $T: E^2 \rightarrow E^2$ is a **linear transformation of E^2** iff $T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$ for each $\mathbf{u}, \mathbf{v} \in E^2$ and $T(\lambda\mathbf{u}) = \lambda T(\mathbf{u})$ for each $\lambda \in \mathbb{R}$ and $\mathbf{u} \in E^2$.

$T: E^2 \rightarrow E^2$ is an **invertible transformation of E^2** iff it is 1-1 and onto E^2 .

Many transformations $T: E^2 \rightarrow E^2$ can be defined by a rule of the form $T(\mathbf{u}) = \mathbf{A}\mathbf{u}$ where \mathbf{A} is a 3×3 matrix of the form

$$\mathbf{A} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ 0 & 0 & 1 \end{bmatrix} \text{ where } a_{ij} \in \mathbb{R}.$$

\mathbf{A} is called the **matrix representation** for T . For some matrices \mathbf{A} , T is a linear transformation.

So, if $\mathbf{u} = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$, then $T(\mathbf{u}) = \mathbf{A}\mathbf{u} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$.

Write matrix representations for each of the following transformations of E^2 .

Translation (slide) defined by (e,f)

Counter clockwise rotation through θ about the origin

Reflection in the y-axis

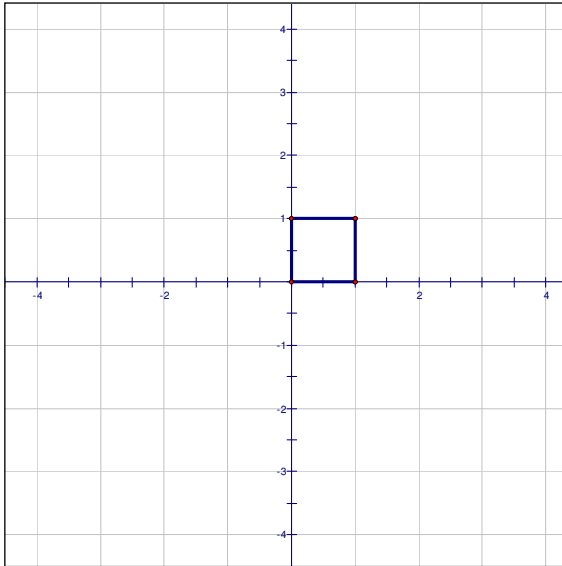

Reflection in the x-axis

Reflection in the line $y = x$

Reflection in the line $y = -x$

Use both geometric thinking and matrix methods to find the image of the unit square under each of the following transformations.

T_1 : a counter clockwise rotation of 60° about the origin.

T_2 : a translation through $(2,1)$ followed by a reflection through the line $y = -x$.

Specify the inverse of each of the transformations T_1 and T_2 .
