

## Math 460 Session #17

### A Standard Form of the LP Model

Choose  $x_1, x_2, \dots, x_n$  so as to

$$\text{Maximize } Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$$

Subject to

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

⋮

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m,$$

and  $x_1, x_2, \dots, x_n \geq 0$ .

### Other Forms

Minimizing rather than maximizing the objective function

Some constraints with greater-than-or-equal-to inequality

Some constraints in less-than-or-equal-to form

Deleting nonnegativity constraints for some decision variables

### Some Terminology

A **feasible solution** is a solution for which *all* the constraints are satisfied.

An **optimal solution** is a feasible solution that has the *most favorable associated value* of the objective function.

A **basic solution** is a solution with no more than  $m$  of the variables assigned nonzero values. (Those variables are basic variables.)

A **basic feasible solution** is a feasible solution with no more than  $m$  of the variables assigned positive values.

A **degenerate basic feasible** solution has fewer than  $m$  of the variables assigned positive values. A **nondegenerate basic feasible** solution is a basic feasible solution with exactly  $m$  variables assigned positive values.

### Assumptions of LP

*Proportionality* – The contribution to the objective function and the amount of resources used in each constraint are proportional to the value of each decision variable.

*Additivity* – The value of the objective function and the total resources used can be found by summing the objective function contribution and the resources used for all decision variables.

*Divisibility* – The decision variables are continuous.

*Certainty* – The parameters of the model (the  $a_{ij}$ ,  $b_i$ , and  $c_j$ ) are known constants.

### The Assumptions in Perspective

Mathematical models are *idealized representations* of real problems (situations).

In many real applications *almost none* of the assumptions will hold completely.

## Special Cases

1.

$$\text{Maximize } Z = 2x_1 + 2x_2$$

st

$$1x_1 + 1x_2 \leq 6$$

$$-1x_1 + 2x_2 \leq 6$$

$$1x_2 \geq 1,$$

and  $x_1, x_2 \geq 0$ .

2.

$$\text{Maximize } Z = -2x_1 + 1x_2$$

st

$$1x_1 + 1x_2 \leq 6$$

$$-1x_1 + 2x_2 \leq 6$$

$$1x_2 \geq 1,$$

and  $x_1, x_2 \geq 0$ .

3.

$$\text{Maximize } Z = 2x_1 + 2x_2$$

st

$$1x_1 + 1x_2 \leq 6$$

$$-1x_1 + 2x_2 \geq 6$$

$$1x_2 \leq 1,$$

and  $x_1, x_2 \geq 0$ .

4.

$$\text{Maximize } Z = 2x_1 + 2x_2$$

st

$$1x_1 + 1x_2 \geq 6$$

$$-1x_1 + 2x_2 \geq 6$$

$$1x_2 \geq 1,$$

and  $x_1, x_2 \geq 0$ .
