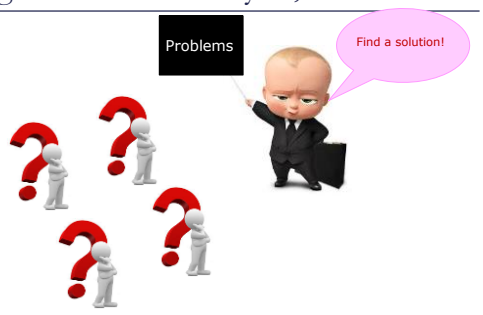
Algorithm and Analysis, What for ?



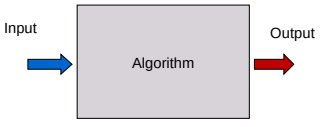
Algorithm and Analysis, What for ?

- Solvable or Unsolvable?
- If solvable, think and find a solution
- Prove it is a correct solution
- Is it enough?

Algorithm and Analysis, What for ?

Algorithm

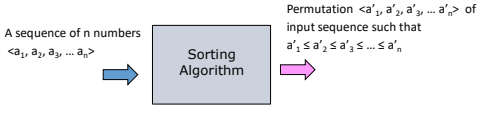
- What is algorithm?
  - An algorithm is any <u>well-defined computational procedure</u> that takes some value, or set of values, as input and produces some value, or set of values, as output.



Algorithm

- An algorithm is <u>a sequence of computational steps</u> that transform the input into the output.
- An algorithm is a tool for solving a well-specified computational problem.

Ex) sorting problem



Algorithm

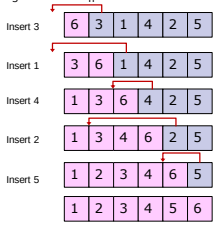
- What is a correct algorithm for solving a problem?
  - An algorithm is said to be correct if it halt with the correct out with every possible input.
- What is the criterion and how to evaluate which algorithm is better?
  - Measure of efficiency is speed – How long an algorithm takes to produce output.
  - By analyzing algorithms mathematically

Analyzing algorithms

- Model of Implementation
  - One processor random access machine – instructions are executed one after another (no concurrent execution!)
  - The Data (input or output) are integer and floating point.
  - Since the time taken by an algorithm grow with the size of the input, the running time of an algorithms can be described as **a function of the size of the input**.
  - The running time of an algorithm on a particular input is the number of primitive operations or steps executed.

Analyzing Sorting Algorithms
(Insertion Sort)

- Input: A sequence of n numbers $<a_1, a_2, a_3, \ldots a_n>$
- Output: Permutation $<a'_1, a'_2, a'_3, \ldots a'_n>$ of input sequence such that $a'_1 \le a'_2 \le a'_3 \le \ldots \le a'_n$



Analyzing Sorting Algorithms
(Insertion Sort)

- For each iteration, a element is placed into right position in sorted sub list.

```
1   Insertion sort (A)                                  
2   {                                                   
3     for j = 2 to length of array A do          ← C1   
4     {                                                 
5       key = A[j]                               ← C2   
6       i = j – 1                                ← C3   
7       while i > 0 and A[i] >key do             ← C4   
8       {                                               
9         A[i +1] = A[i]                         ← C5   
10        i = i –1                               ← C6   
11      }                                               
12      A[i +1] = key                            ← C7   
13    }                                                 
14  }                                                   
```

(Insertion Sort: Worst Case)

```
1   Insertion sort (A)
2   {
3     for j = 2 to length of array A do        C1(n − 1)
4     {
5       key = A[j]                             C2(n − 1)
6       i = j − 1                              C3(n − 1)
7       while i > 0 and A[i] >key do           C4(n(n−1)/2 − 1)
8       {
9         A[i +1] = A[i]                       C5(n(n−1)/2)
10        i = i −1                             C6(n(n−1)/2)
11      }
12      A[i +1] = key                          C7(n − 1)
13    }
14  }
```

$$T(n) = \left(\frac{C_4}{2} + \frac{C_5}{2} + \frac{C_6}{2}\right)n^2 + \left(C_1 + C_2 + C_3 + \frac{C_4}{2} - \frac{C_5}{2} - \frac{C_6}{2} + C_7\right)n - (C_1 + C_2 + C_3 + C_4 + C_7)$$

Basic Sorting Algorithms
(Insertion Sort Analysis)

Insertion Sort Analysis

- Best Case (order of growth = n)

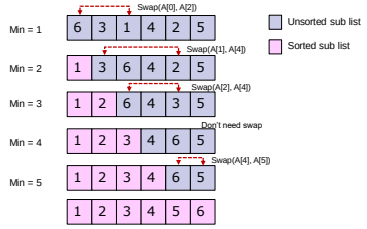
$$T(n) = C_1(n-1) + C_2(n-1) + C_3(n-1) + C_4(n-1) + C_7(n-1)$$
$$= (C_1 + C_2 + C_3 + C_4 + C_7)n - (C_1 + C_2 + C_3 + C_4 + C_7)$$

- Worst Case: (order of growth = n^2)

$$T(n)$$
$$= C_1(n-1) + C_2(n-1) + C_3(n-1) + C_4\left(\frac{n(n+1)}{2} - 1\right) + C_5\left(\frac{n(n-1)}{2}\right) + C_6\left(\frac{n(n-1)}{2}\right) + C_7(n-1)$$
$$= \left(\frac{C_4}{2} + \frac{C_5}{2} + \frac{C_6}{2}\right)n^2 + \left(C_1 + C_2 + C_3 + \frac{C_4}{2} - \frac{C_5}{2} - \frac{C_6}{2} + C_7\right)n - (C_1 + C_2 + C_3 + C_4 + C_7)$$

Analyzing Sorting Algorithms
(Selection Sort)

- Input: A sequence of n numbers <a_1, a_2, a_3, … a_n>
- Output: Permutation <a'_1, a'_2, a'_3, … a'_n> of input sequence such that $a'_1 \le a'_2 \le a'_3 \le \ldots \le a'_n$



Analyzing Sorting Algorithms
(Selection Sort)

- For each iteration, a minimum is found in the sub list and it is placed into right position in sorted sub list.

```
1   Selection sort (A)
2   {
3     for j = 0 |A|-1 do                  C1
4     {
5       Min = j                           C2
6       for k= j+1 to |A|-1               C3
7       {
8         if A{k} <A[Min] then            C4
9           Min = k                       C5
10      }
11      If Min ≠ j                        C6
12        Swap (A[j], A[Min])             C7
13    }
14  }
```

$C_3 \frac{n(n-1)}{2}$

$C_4 \frac{n(n-1)}{2}$

Basic Sorting Algorithms
(Bubble Sort Analysis)

Bubble Sort Analysis

- Best Case:(order of growth = n^2)

$$T(n) = C_1 n + C_2(n-1) + C_3 \frac{n(n-1)}{2}$$
$$= \frac{C_3}{2} n^2 + \left(C_1 + C_2 - \frac{C_3}{2}\right) n - C_2$$

- Worst Case:(order of growth = n^2)

$$T(n) = C_1 n + C_2(n-1) + C_3 \frac{n(n-1)}{2} + C_4 \frac{n(n-1)}{2}$$
$$= \left(\frac{C_3}{2} + \frac{C_4}{2}\right) n^2 + \left(C_1 + C_2 - \frac{C_3}{2} - \frac{C_4}{2}\right) n - C_2$$

Analyzing Sorting Algorithms

- Importance of Worst Case Analysis
  - The worst-case running time gives an upper bound on the running time for any input.
  - For some algorithms, the worst case occurs fairly often.
  - The average case is usually as bad as the worst case.

Analyzing Sorting Algorithms

- Instead of using exact running time, we can use simplifying abstractions to ease our analysis of algorithms.
- We can use asymptotic notation for describing the speed of a algorithm as order of growth based on the input size n.
- Ex) Insertion sort
  - best case: order of growth = n
  - worst case: order of growth = n^2

Asymptotic Notations (Big - Θ)

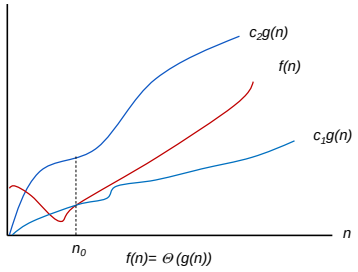
Θ -Notation

- For a given function *g(n)*, we denote by Θ(*g(n)*) the set of functions such that

  Θ(*g(n)*) = {*f(n)* |there exist any positive constant c_1, c_2 and n_0 such that $0 \le c_1 g(n) \le f(n) \le c_2 g(n)$ for all $n \ge n_0$}

- *f(n)* = Θ(*g(n)*) indicate a function *f(n)* is a member of Θ(*g (n)*). - *g(n)* is *asymptotically tight bound* for *f (n)*.

Asymptotic Notations (Big - Θ)



Asymptotic Notations (Big - Θ)

Ex) Show $\frac{1}{2}n^2 - 3n = \Theta(n^2)$

We need to find out positive c_1, c_2 and n_0 such that

$$c_1 n^2 \le \frac{1}{2}n^2 - 3n \le c_2 n^2 \text{ for all } n \ge n_0$$

$$c_1 \le \frac{1}{2} - \frac{3}{n} \le c_2$$

$$c_1 \le \frac{1}{2} - \frac{3}{n} \text{ is hold with } c_1 \le \frac{1}{14} \text{ and } n \ge 7$$

$$\frac{1}{2} - \frac{3}{n} \le c_2 \text{ is hold with } c_2 \ge \frac{1}{2} \text{ and } n \ge 1$$

$$\frac{1}{14}n^2 \le \frac{1}{2}n^2 - 3n \le \frac{1}{2}n^2 \text{ is hold with } n \ge 7$$

Asymptotic Notations (Big - Θ)

$let\ f(n) = \frac{1}{2} - \frac{3}{n}\ with\ n > 1$

n	1	2	3	4	5	6	7	8
$f(n)$	$-\frac{5}{2}$	-1	$-\frac{1}{2}$	$-\frac{1}{4}$	$-\frac{1}{10}$	0	$\frac{1}{14}$	..

$$c_1 \le \frac{1}{2} - \frac{3}{n} \text{ is hold with } c_1 \le \frac{1}{14} \text{ and } n \ge 7$$

Asymptotic Notations (Big O)

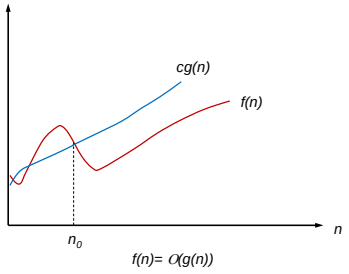
Big O-Notation

- For a given function *g (n)*, we denote by **O**(*g (n)*) the set of functions such that,

  O(*g(n)*)= {*f (n)* | there exist positive constant c and n_0 such that $0 \le f(n) \le cg(n)$ for all $n \ge n_0$}

- We write *f (n)* = **O** (*g(n)*) indicates a function *f (n)* is a member of **O** (*g(n)*). - *g (n)* is *asymptotically upper bound* for *f (n)*.

Asymptotic Notations (Big O)



$f(n) = O(g(n))$

Asymptotic Notations (Big O)

- $f(n) = \Theta(g(n)) \subseteq f(n) = \mathbf{O}(g(n))$,
  - since Θ-notation is stronger notation than **O**-notation.
- Written set-theoretically,

  $\Theta(g(n)) \subseteq \mathbf{O}(g(n))$.

Asymptotic Notations (Big O)

Ex) Show that $17n^2 - 5 = O(n^2)$

Sol)

- Based on big-O notation, we need find two integer c and n_0 such that

  $17n^2 - 5 \leq c\, n^2$ *for all* $n \geq n_0$
- With c = 17 and $n_0 = 1$

  $17n^2 - 5 \leq 17\, n^2$ for all $n \geq 1$

  $\therefore 17n^2 - 5 = O(n^2)$

Asymptotic Notations (Big O)

Ex) Show that $35n^3 + 100 = O(n^3)$

- Based on the Big-O notation, we need find two integer c and n_0 such that

  $35n^3 + 100 \leq c\, n^3$ *for all* $n \geq n_0$
- With c = 36 and $n_0 = 5$

  $35n^3 + 100 \leq 36\, n^3$ *for all* $n \geq 5$

  $\therefore 35n^3 + 100 = O(n^3)$

Asymptotic Notations (Big O)

Ex) Show $6 \times 2^n + n^2 = O(2^n)$

- Based on the Big-O notation, we need find two integer c and n_0 such that

  $6 \times 2^n + n^2 \leq c \times 2^n$ for all $n \geq n_0$
- With c = 7 and $n_0 = 5$

  $6 \times 2^n + n^2 \leq 7 \times 2^n$ for all $n \geq 5$

  $\therefore 6 \times 2^n + n^2 = O(2^n)$

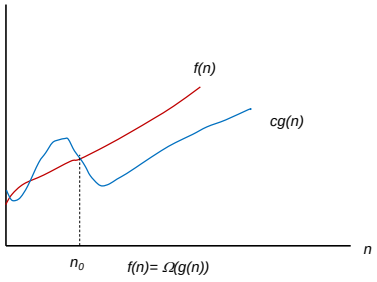
Asymptotic Notations (Big Ω)

Big Ω -Notation

- For a given function $g(n)$, we denote by $\Omega(g(n))$ the set of functions such that

  $\Omega(g(n)) = \{f(n) \mid$ there exist positive constant c and n_0 such that $0 \leq cg(n) \leq f(n)$ for all $n \geq n_0\}$
- We write $f(n) = \Omega(g(n))$ indicate a function $f(n)$ is a member of $\Omega(g(n))$ - $g(n)$ is *asymptotically lower bound* for $f(n)$.

Asymptotic Notations (Big Ω)



Asymptotic Notations (Big Ω)

Ex) Show $3n + 2 = \Omega(n)$

- By Big- Ω notation we need to find out two integer c and n_0 such that
  $3n + 2 \geq cn$ for all $n \geq n_0$
- With c=1 and $n \geq 1$,
  $3n + 2 \geq n$ for all $n \geq 1$
  $\therefore 3n + 2 = \Omega(n)$

Asymptotic Notations (Big Ω)

Ex) Show $2^n + n^3 = \Omega(n^{100})$

- By Big- Ω notation we need to find out two integer c and n_0 such that
  $2^n + n^3 \geq c\, n^{100}$ for all $n \geq n_0$
- With c = 1 and large enough n_0,
  $2^n + n^3 \geq n^{100}$ for all $n \geq n_0$ is true, since left hand side glows exponentially and right hand side glows by polynomial
